

Cover Letter

Dear Editor,

Please consider our manuscript entitled “Auditing constrained geospatial allocation under annual land-cover product uncertainty” for publication as a Research Article in Landscape and Urban Planning.

The manuscript evaluates Geospatial Kernel, the algorithmic core of a Geospatial World Model, as an auditable execution layer for constrained spatial allocation. Using two public annual land-cover product tracks for Abu Dhabi, it tests whether model rankings are robust to product choice while retaining explicit proposal, constraint-projection and state-writeback traces.

The study is deliberately framed as a public-data benchmark and conditional planning stress test, rather than as an official forecast of Abu Dhabi statutory land-use change. The refreshed source release, including the ArcGIS-served product track, is archived at <https://doi.org/10.5281/zenodo.22689057>; hydrated Git LFS artifacts are retrieved from the corresponding v2.0.0 repository tag.

I confirm that the manuscript is original, is not under consideration by another journal, and has been approved for submission.
